

Xingyu Su

✉ xingyusu@sjtu.edu.cn ☎ +8613627655821 📍 Shanghai, China ➡ <https://sux1ngyu.github.io>

🎓 EDUCATION

- Shanghai Jiao Tong University, School of Electrical and Electronic, Master / Electrical Information** 2020 Sep – 2023 Mar
Shanghai, China
- GPA: 3.4 / 4.0 (top 30%)
 - Lab of Data Driven Software Technology
 - Core Courses: Machine Learning, Deep Learning, Optimization, Database, Data Structure and Algorithm, Casual Inference
- Shanghai Jiao Tong University, Joint Institute of Shanghai Jiao Tong University & University of Michigan, Bachelor / Mechanical Engineering** 2016 Sep – 2020 Aug
Shanghai, China
- GPA: 3.5 / 4.0 (top 20%)
 - Scholarship: Undergraduate Merit Scholarship (2018 - 2019), Fuda Scholarship (2018-2019)

📖 PUBLICATIONS

- [1] **Su, X.**, Shen, Y. (2022, December). "Tab-HGNN: Learning Column Representation with Heterogeneous Graph Neural Network for Web Table Interpretation." In 2022 IEEE International Conference on Big Data (Big Data). IEEE. 2022 Dec 17

💼 PROFESSIONAL EXPERIENCE

- Intel Corporation, The Artificial Intelligence and Analytics (AIA) Division, Machine Learning Intern** 2022 Aug – 2022 Dec
Shanghai, China
- Research on Neural Architecture Search of Graph Neural Network
- NIO. Inc., Autonomous Driving Development - Perception Department, Perception Algorithm Intern** 2022 Jul – 2022 Aug
Beijing, China
- Data production. Extract information to supplement the existing SQL database; use SQL commands to get the required data.
 - Data preparation. Use Pandas to develop automatic driving datasets.

📁 PROJECTS

- Risk Analysis of Letters and Visits for Judicial Data,** 2021 Sep – 2022 Feb
Shanghai Jiao Tong University & Shanghai Huigu Information Co., LTD.
- Use Python to perform data pre-processing on the identity and case information (tabular data) of about 100,000 cases.
 - Use NLP methods (BERT for Chinese Legal Documents) to consider the text information of the case indictment, in order to participate the evaluation of the risk analysis.
 - Use machine learning model (Logistic Regression) to predict the risk of letters and visits. Use EasyEnsemble to deal with the class imbalance problem.
 - Achieve ~0.7 F1 scores on testing data. We can find the key factors that affect the risk level of the current case (such as: education level, causes of cases, etc.).
- Automobile Warranty Cost Forecasting Analysis,** 2020 May – 2020 Aug
Shanghai Jiao Tong University - Data-Informed Design and Intelligent System Laboratory
- Data cleaning and analysis on automobile maintenance dataset. Use Python to preprocess data on about 500,000 automobile maintenance records from auto repair shops in Shanghai, including data cleaning, data selection and feature extraction.
 - Using R and Python, based on 2D warranty model, estimate the number of failures per month by the Non-Homogeneous Poisson Process. Make reasonable assumption that the distribution of usage rate is linear.
 - Use Python to construct models (such as multi-linear regression, support vector machine) on the failure rate based on time and mileage of automobiles. Obtain 0.97 correlation coefficient in the synthetic test dataset.
