EDUCATION

Shanghai Jiao Tong University, School of Electrical and Electronic 2020/09 – 2023/03 | Shanghai, China
Master in Electronic Information

- Advised by Prof. Yanyan Shen.

Joint Institute of Shanghai Jiao Tong University & UMich 2016/09 – 2020/08 | Shanghai, China
Bachelor in Mechanical Engineering

GPA: 3.5/4.0 (rank: 4/33)

GPA of last two years: 3.66/4.0

Scholarships: Undergraduate Merit Scholarship (2018 - 2019), Fuda Scholarship (2018-2019)

PUBLICATIONS

2022/12/20

[1] **Su, X.**, Shen, Y. (2022, December). "Tab-HGNN: Learning Column Representation with Heterogeneous Graph Neural Network for Web Table Interpretation." In 2022 IEEE International Conference on Big Data (Big Data). IEEE.

PROFESSIONAL EXPERIENCE

Machine Learning Intern 2022/08 – 2022/12 | Shanghai, China
Intel Corporation, The Artificial Intelligence and Analytics (AIA) Division

- Research on Neural Architecture Search of Graph Neural Network
- Research on Automatic Data Processing and Feature Engineering

Perception Algorithm Intern 2022/07 – 2022/08 | Beijing, China
NIO, Inc., Autonomous Driving Development - Perception Department

- Data production. Extract information to supplement the existing SQL database; use SQL commands to get the required data.
- Data preparation. Use Pandas to develop automatic driving datasets.

Teaching Assistant 2019/02 – 2019/05 | Shanghai, China
Shanghai Jiao Tong University

- Working as Teaching Assistant for course VM382 - Mechanical Behaviors of Materials

PROJECTS

Risk Analysis of Letters and Visits for Judicial Data 2021/09 – 2022/02
Shanghai Jiao Tong University & Shanghai Huigu Information Co., LTD.

- Use Python to perform data pre-processing on the identity and case information (tabular data) of about 100,000 cases.
- Use machine learning model (Logistic Regression, XGBoost, Neural Network) to predict the risk of letters and visits.
- Achieve ~0.7 F1 scores on testing data. We can find the key factors that affect the risk level of the current case (such as: education level, causes of cases, etc.).

Automobile Warranty Cost Forecasting Analysis 2020/05 – 2020/08
Shanghai Jiao Tong University - Data-Informed Design and Intelligent System Laboratory

- Research Assistant
- Data cleaning and analysis on automobile maintenance dataset. Use Python to preprocess data on about 500,000 automobile maintenance records from auto repair shops in Shanghai, including data cleaning, data selection and feature extraction.
 - Using R and Python, based on 2D warranty model, estimate the number of failures per month by the Non-Homogeneous Poisson Process. Make reasonable assumption that the distribution of usage rate is linear.
 - Use Python to construct models (such as multi-linear regression, support vector machine) on the failure rate based on time and mileage of automobiles. Obtain 0.97 correlation coefficient in the synthetic test dataset.
